Teaching Session 6 - Interactive
Tuesday, October 15, 16:30-18:00

Session Title
Radiological Aspects of Abdominal Anatomy

Educational Objectives / Summary

The teaching programme will focus on CT, MRI and PETCT anatomical features that should be highlighted by the reporting nuclear medicine physician and included in the report.

Such features are often very important to the referring clinician or surgeon.

These areas are often overlooked in reports and can make a critical difference to the patient management.

Contributors

Tom Lynch (Belfast, United Kingdom)
Kieran McManus (Belfast, United Kingdom)
Nicholas Magee (Belfast, United Kingdom)

Programme

Section A:

1. Anatomical overview of the Abdomen
2. Liver, splenic, renal, colonic, mesenteric and gastric lesions and variants
3. Overview of cancer staging for colon cancer

Section B:

1. What additional radiological information is required by the surgeon, referring physician or oncologist?
2. How to incorporate this additional information to make your report as relevant and helpful as possible.
3. How to structure a bespoke report for the referrer.....and understand what they need from YOU.

e.g. vascular disease, congenital lesions, acquired lesions, renal, liver and pancreatic disease, bowel lesions, lines, tubes, monitors, implanted devices and post-operative appearances

Section C:

A **Live and Interactive Anatomy Test** will be carried out during the session with a prize for the top score.
